

BOARD PARTITIONS FOR A 6×8 BOARD WITH 3 BLOCKERS

This table is a resource for the paper “Towards a Canonical Representation of Blocked Rectangular Grids with an Application to Finite Tiling Problems” by Noah Jensen and Stephanie Treneer. The example that generates this table is that of a game board composed of 6×8 square cells and with 3 blockers placed on the board. This table lists a board partition, defined in the referenced paper, K the subgroup of $\langle H, V \rangle$, the symmetry group of a rectangle, under which the board partition remains invariant, and each index $[\langle H, V \rangle : K]$. There are 5 entries.

Board partitions for a 5×5 board with 10 blockers

Board Partition	K	$[\langle H, V \rangle : K]$
(1,1,1,0)	$\langle e \rangle$	4
(2,0,0,1)	$\langle e \rangle$	4
(2,0,1,0)	$\langle e \rangle$	4
(2,1,0,0)	$\langle e \rangle$	4
(3,0,0,0)	$\langle e \rangle$	4
